Experiment - 6

Student Name: Raunak Kumar UID: 23BCS11270

Branch: BE-CSE Section/Group: KRG_2A

Semester: 5th **Date of Performance:** 25/9/25

Subject Name: Advanced Database and Management System

Subject Code: 23CSP-333

1. Aim:

Medium-Problem Title: Gender Diversity Tracking-Create a PostgreSQL stored

procedure to track gender diversity in the workforce. The procedure takes a gender as input and returns the total number of employees of that gender, providing HR with instant and secure

reporting.

Procedure (Step-by-Step):

- 1. Create a table employees with columns like emp id, emp name and gender.
- 2. Insert sample data with varying genders.
- 3. Create a stored procedure 'count_employees_by_gender' that:
 - Takes a gender as input.
 - Counts the number of employees with that gender.
 - Returns the result as an OUT parameter.
- 4. Call the procedure in a DO block to capture and display the result.

Sample Output Description:

```
- Input: 'Male' --- Output: 3
```

- Input: 'Female' --- Output: 2
- -HR sees results instantly without accessing full employee data.

Source Code

```
CREATE TABLE employees
(emp_id SERIAL PRIMARY KEY,
emp_name VARCHAR(100),
gender VARCHAR(10));
```

-- Sample data

INSERT INTO employees (emp_name, gender) VALUES

('Amit', 'Male'),

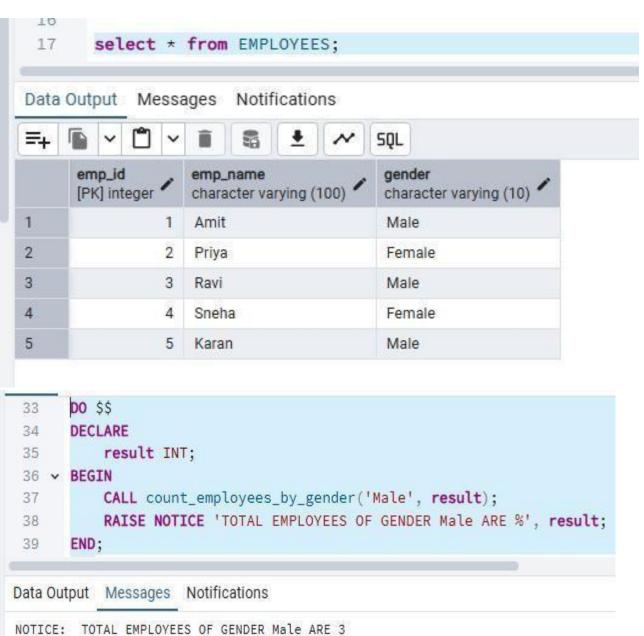

('Priya', 'Female'),

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING Discover. Learn. Empower.

```
('Ravi', 'Male'),
  ('Sneha', 'Female'),
  ('Karan', 'Male');
  select * from EMPLOYEES;
  ----CREATING A PROCEDURE----
  CREATE OR REPLACE PROCEDURE
     count employees by gender (IN input gender VARCHAR,
         OUT total count int
  LANGUAGE plpgsql
  AS $$
  BEGIN
    SELECT COUNT(*) INTO total_count
    FROM employees
    WHERE gender = input gender;
  END;
  $$;
  ---CALLING THE PROCEDURE-----
  DO
  $$
DECLA RE
    result INT;
  BEGIN
    CALL count_employees_by_gender('Male', result);
    RAISE NOTICE 'TOTAL EMPLOYEES OF GENDER Male ARE %', result;
  END;
  $$;
```

DO

Query returned successfully in 104 msec.

Hard-Problem Title:

Order Placement and Inventory Management-Automate the ordering process in a retail company. The procedure validates stock availability, logs sales, updates inventory, and provides real-time confirmation or rejection messages.

Procedure (Step-by-Step):

- Create products table with columns: product_id, product_name, price, quantity_remaining, quantity_sold.
- Create sales table with columns: sale_id, product_id,quantity, total_price, sale_date.
- Create a stored procedure place_order that:
 - Takes product_id and quantity as input.
 - Checks if quantity remaining is sufficient.
 - o If yes:
 - Logs the sale in sales table.
 - o Updates products(decrease quantity remaining, increase quantity sold).
 - Display "Product sold successfully!!".
 - o If no:
 - Display "Insufficient quantity available!!"
- Call the procedure for different orders to validate functionality.

Sample Output Description:

- Order 5 units of Smartphone (stock available): "Product sold successfully!".
- Order 100 units of Tablet (insufficient stock): "Insufficient Quantity Available!".
- Inventory updates automatically for successful orders.

Objective: The objective is to automate critical business operations using PostgreSQL stored procedures. For HR, it tracks gender diversity by returning the total count of employees by gender. For retail, it manages orders by validating stock, logging sales, updating inventory, and providing real-time confirmation or rejection messages. This ensures efficiency, accuracy, and real-time insights in both workforce and inventory management.
